# Optimisation problems: standard techniques

## Example 1.

Let  $A = \{a_1, \dots, a_n\}$  and  $m < n$

Find a subset  $S$  of  $A$  such that:

- (i) The cardinal of  $S$  is  $m$  (**constraint**)
- (ii) The sum of elements in  $S$  is maximal (**optimization criterion**)

**Remark.**  $X =$  the set of all  $2^n$  subsets of  $A$

A brute force approach is of  $O(2^n)$ .

# Optimisation problems: greedy techniques

Let's reformulate the optimization problem as follows:

*Let  $A=(a_1, \dots, a_n)$  be a multiset (a set of not necessarily distinct elements).  
Find  $S=(s_1, \dots, s_k)$  such that  $S$  satisfies some constraints and  
optimizes a certain criterion.*

Basic idea of greedy technique:

- $S$  is constructed **successively** starting with the first element
- At each step a new element (that element which seems to be the best at that moment) is **selected** from  $A$ .
- Once a choice is made it is **final** (the greedy approach at each step takes the currently best element, without regard for future consequences; there are no back steps to make corrections)

# Optimisation problems: greedy techniques

## Pseudocode example

The general structure of a greedy algorithm:

Greedy(A)

$S \leftarrow \emptyset$

WHILE “S is not completed” AND “there exist unselected elements in A”

DO

    “choose the **best** currently available element a from A”

    IF “by adding a to S the **constraints are satisfied**”

        THEN “**add a to S**”

RETURN S

# Optimisation problems: greedy techniques

## Pseudocode example

The general structure of a greedy algorithm:

Greedy(A)

$S \leftarrow \emptyset$

WHILE “S is not completed” AND “there exist unselected elements in A”

DO

“choose the **best** currently available element a from A”

IF “by adding a to S the **constraints are satisfied**”

THEN “**add a to S**”

RETURN S

P.S. The selection criterion is frequently based on some heuristics (= technique based on experiential data and intuition rather than on theoretical analysis).

# Optimisation problems: greedy techniques

Are there algorithms, **where greedy algorithms won't lead to globally good solutions**? Yes, e.g. some problems do not have optimal solutions, in cases of weighted graphs algorithms, when the structure of the set on which the algorithm is running is not a matroid.

# Optimisation problems: greedy techniques

Are there algorithms, where greedy algorithms will lead to globally good solutions?

```
Subset(A[1..n],m) //variant1
FOR i ← 1,m DO
  k ← i
  FOR j ← i+1,n DO
    IF A[k]<A[j] THEN k ← j  ENDIF
  ENDFOR
  IF k<>i THEN A[k]↔A[i] ENDIF
  S[i] ← A[i]
ENDFOR
RETURN S[1..m]
```

# Optimisation problems: greedy techniques

Are there algorithms, where greedy algorithms will lead to globally good solutions?

```
Subset(A[1..n],m) //variant1
FOR i ← 1,m DO
  k ← i
  FOR j ← i+1,n DO
    IF A[k]<A[j] THEN k ← j  ENDIF
  ENDFOR
  IF k<>i THEN A[k]↔A[i] ENDIF
  S[i] ← A[i]
ENDFOR
RETURN S[1..m]
```

# Materials on the optimisation problems

Are there algorithms, where greedy algorithms will lead to globally good solutions?

# Projects preparations

**Examples of libraries for spatial analysis:** osmnx (getting data, visualisation), scikitlearn (classification analysis), networkx (network analysis, EDA for spatial analysis methods), iduedu (connectivity patterns)

Identification of problems for network analysis from [optimisation tasks](#):

**Pipeline of steps in your notebook, find the [template](#) here:**

- 1) Extraction of the raw data (from osm - osmnx or mapbox) which has many layers of information or use already existing [data](#), data cleaning, data preprocessing - **format as geojson, csv**
- 2) Formalisation of the research question from the list here [optimisation tasks](#):
  - a) landuse specification (given some specific limitations of the territories),
  - b) optimal transportation e.g. network connectivity tasks
- 3) Formalisation of the research questions related to network science/optimisation algorithms for 2):
  - a) given your assigned labels of the tiles in your land, assign labels to the rest of tiles (classification task)
  - b) optimal transportation e.g. network connectivity tasks [networkx](#) - **format of the data is graph G**

# Projects preparations

**Example of the project** network connectivity tasks:

- 1) Extraction of the raw data (from osm - osmnx or mapbox) which has many layers of information or use already existing data, data cleaning, data preprocessing - **format as geojson, csv**
- 2) Formalisation of the research question from the list here optimisation tasks:  
network connectivity tasks
- 3) Formalisation of the research questions related to network science/optimisation algorithms for 2):  
optimal transportation e.g. network connectivity tasks networkx - **format of the data is graph G**

Studying traditional network centrality measures like:

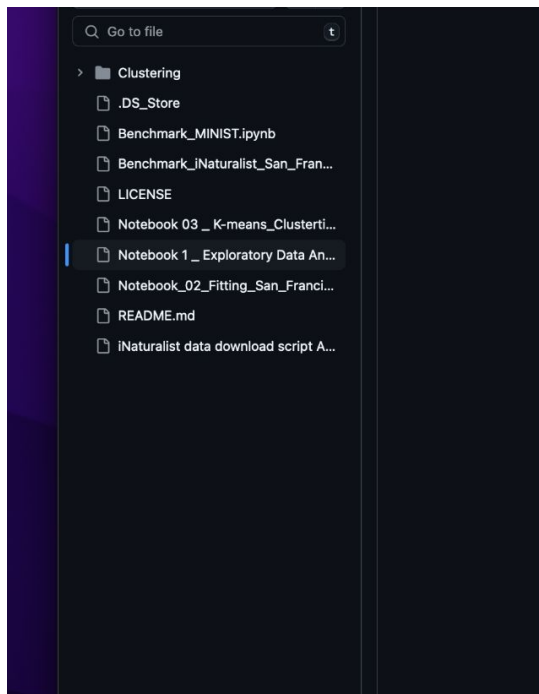

Identification of bottlenecks in graph G = nodes in a graph with high betweenness centrality

Suggest some of the possible improvements, e.g connecting additional nodes to the network

- 4) Assess the complexity of your algorithm
